**DETAILED ACTION**

***Claim Objections***

1. Claims 4-11 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claims 1-3. See MPEP § 608.01(n). Accordingly, the claims 4-11 have not been further treated on the merits.

***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-11 are rejected under 35 U.S.C. 102(b) as being unpatentable by Roederere et al (US 5,264,861).

Regarding claims 1 and 5-11, Roederere discloses a circular polarization antenna having a series strands (8 -10) located substantially in one and the same main plane, each of the strands (8-10) being powered by one and the same conducting wire (6), characterised that each of these strands (8-10) describes an initial segment which is radial relative to a geometric axis (1) perpendicular to the main plane (2), then each of the strands(8-10) is extended along a circle arc (10) centred on this geometric axis (1) then describes again a substantially radial segment , directed in the direction of the geometric axis (1), thus running alongside radial segment the neighbouring strand(8-9) without touching it. See figure, col.2, lines 17-67 to col.3, lines 1-67.

Regarding claim 2, Roederere discloses the power wire (6) of the strands (8-10) is constituted by a rigid rectilinear wire merged with the geometric axis (1). See figure.

Regarding claim 3, Roederere discloses that each strand (8-10) describes circle arc (10) according to one and the same direction of rotation around the axis (1), in such a way that for each strand (8-10) considered, the radial end segment of this strand runs alongside an initial radial segment of a neighbouring strand. See figure.

Regarding claim 4, Roederere discloses that the array of strands (8-10) describes a circular perimeter of diameter (11). See figure.

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Suehiro (US 4, 64,7937) and Schotz (US 4,947,180) are cited to show a circular polarization antenna.
